Finite State Machines

A deterministic finite state automaton (DFA) $A = (Q, \Sigma, \delta, q_0, F)$

- ▶ Q is a finite set of states
- ▶ Σ is a finite alphabet
- ▶ $\delta : Q \times \Sigma \rightarrow Q$ is the transition function
- ▶ $q_0 \in Q$ is the initial state
- ▶ $F \subseteq Q$ is the set of final states
- ▶ $L(A)$ =all words leading from q_0 to some $f \in F$

Languages, Machines and Logic

A language $L \subseteq \Sigma^*$ is called **regular** iff there exists some DFA A such that $L = L(A)$.

A language $L \subseteq \Sigma^*$ is called **FO-definable** iff there exists an FO formula φ such that $L = L(\varphi)$.

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- ▶ Begins with a , ends with b , and has a pair of consecutive a 's
- ▶ Contains a b and ends with aa
- ▶ Contains abb
- ▶ There are two occurrences of b between which only a 's occur
- ▶ Right before the last position is an a
- ▶ Even length words

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- Contains *abb*

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- Contains *abb*

$$\exists x \exists y \exists z (Q_a(x) \wedge Q_b(y) \wedge Q_b(z) \wedge S(x, y) \wedge S(y, z))$$

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

► Contains *abb*

$$\exists x \exists y \exists z (Q_a(x) \wedge Q_b(y) \wedge Q_b(z) \wedge S(x, y) \wedge S(y, z))$$

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- Contains *abb*

$$\exists x \exists y \exists z (Q_a(x) \wedge Q_b(y) \wedge Q_b(z) \wedge S(x, y) \wedge S(y, z))$$

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

► Contains *abb*

$$\exists x \exists y \exists z (Q_a(x) \wedge Q_b(y) \wedge Q_b(z) \wedge S(x, y) \wedge S(y, z))$$

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- Contains *abb*

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

► Contains *abb*

$$\exists x \exists y \exists z (Q_a(x) \wedge Q_b(y) \wedge Q_b(z) \wedge S(x, y) \wedge S(y, z))$$

Is it Regular? Is it FO-definable?

$\Sigma = \{a, b\}$. Consider the following languages $L \subseteq \Sigma^*$:

- ▶ Right before the last position is an a :

Is it Regular? Is it FO-definable?

Deterministic Finite Automata

- ▶ Every state on every symbol goes to a unique state
 - ▶ $\delta : Q \times \Sigma \rightarrow Q$ is a transition function
- ▶ Given a string $w \in \Sigma^*$ and a state $q \in Q$, iteratively apply δ
 - ▶ $w = aab$
 - ▶ $\delta(q, a) = q_1$,

Deterministic Finite Automata

- ▶ Every state on every symbol goes to a unique state
 - ▶ $\delta : Q \times \Sigma \rightarrow Q$ is a transition function
- ▶ Given a string $w \in \Sigma^*$ and a state $q \in Q$, iteratively apply δ
 - ▶ $w = aab$
 - ▶ $\delta(q, a) = q_1, \delta(\delta(q, a), a) = \delta(q_1, a) = q_2,$

Deterministic Finite Automata

- ▶ Every state on every symbol goes to a unique state
 - ▶ $\delta : Q \times \Sigma \rightarrow Q$ is a transition function
- ▶ Given a string $w \in \Sigma^*$ and a state $q \in Q$, iteratively apply δ
 - ▶ $w = aab$
 - ▶ $\delta(q, a) = q_1, \delta(\delta(q, a), a) = \delta(q_1, a) = q_2,$
 $\delta(\delta(\delta(q, a), a), b) =$

Deterministic Finite Automata

- ▶ Every state on every symbol goes to a unique state
 - ▶ $\delta : Q \times \Sigma \rightarrow Q$ is a transition function
- ▶ Given a string $w \in \Sigma^*$ and a state $q \in Q$, iteratively apply δ
 - ▶ $w = aab$
 - ▶ $\delta(q, a) = q_1, \delta(\delta(q, a), a) = \delta(q_1, a) = q_2,$
 $\delta(\delta(\delta(q, a), a), b) = \delta(\delta(q_1, a), b) =$

Deterministic Finite Automata

- ▶ Every state on every symbol goes to a unique state
 - ▶ $\delta : Q \times \Sigma \rightarrow Q$ is a transition function
- ▶ Given a string $w \in \Sigma^*$ and a state $q \in Q$, iteratively apply δ
 - ▶ $w = aab$
 - ▶ $\delta(q, a) = q_1, \delta(\delta(q, a), a) = \delta(q_1, a) = q_2,$
 $\delta(\delta(\delta(q, a), a), b) = \delta(\delta(q_1, a), b) = \delta(q_2, b) = q_3$
 - ▶ $\hat{\delta} : Q \times \Sigma^* \rightarrow Q$ extension of δ to strings
 - ▶ $\hat{\delta}(q, \epsilon) = q$
 - ▶ $\hat{\delta}(q, wa) = \delta(\hat{\delta}(q, w), a)$

DFA : Transition Function on Words

DFA : Transition Function on Words

- ▶ $\hat{\delta}(q, wa) = s = \delta(\hat{\delta}(q, w), a) = \delta(r, a)$
- ▶ $\hat{\delta}(q, wb) = t = \delta(\hat{\delta}(q, w), b) = \delta(r, b)$

DFA Acceptance

- ▶ $w \in \Sigma^*$ is accepted iff $\hat{\delta}(q_0, w) \in F$
- ▶ $w \in \Sigma^*$ is rejected iff $\hat{\delta}(q_0, w) \notin F$
- ▶ Any string $w \in \Sigma^*$ is either accepted or rejected by a DFA A
- ▶ $L(A) = \{w \in \Sigma^* \mid \hat{\delta}(q_0, w) \in F\}$
- ▶ $\Sigma^* = L(A) \cup \overline{L(A)}$

DFA States

- ▶ Each state is a **bucket** holding infinitely many words
- ▶ Thus we have good and bad buckets
- ▶ The buckets partition Σ^*
- ▶ **Good buckets** determine the language accepted by the DFA
- ▶ Words that land in bad buckets are not accepted by the DFA
